

# AI and Primary Care

## Summary of Discussion

Artificial Intelligence (AI) is rapidly shaping primary care, offering new opportunities to improve clinical decision making, streamline documentation, and improve outcomes. In this presentation, Eric Schneider, MD from the Harvard School of Public Health explores practical applications of AI in the primary care setting, discussing both the promises such as improved outcomes and access, as well as the risks, including equity concerns, dissolution of therapeutic relationships, and uncertain outputs. Dr. Schneider will share strategies and necessary guardrails that are needed to integrate these tools into everyday practice while maintaining high-quality, patient-centered care.
